

What is HHW?

Household hazardous wastes are substances that poison or contaminate the environment and threaten the health of those in the local community. They may be flammable, corrosive, reactive, or toxic. HHW should be disposed of properly to prevent harm to people, soil and water sources.

Environment

If these products are poured down the sink or storm drains, they can pollute our drinking water, pollute our soil, threaten wildlife and the local ecosystem.

Health & Safety

If hazardous materials are mixed together or disposed of in the trash, it could react and produce toxic fumes, explosions, or fires which could cause injury. Improper storage of these materials can lead to accidental poisoning of children.

Illegal Dumping

When waste is difficult or costly to dispose of it can lead people to use illegal dumping methods. This is a crime and can cost the community upwards of \$100,000 to dispose of properly.
